## Graphics systems in R

There are many graphics systems in R for making plots and figures.

We have already played a little with “**base R**” graphics and the ‘plot()’ function.

Today we will start learning about a popular graphics package called ‘ggplot2()’.

This is an add-on package - i.e. we need to install it. I install it (like I install any packages) with the ‘install.packages()’ function.

```
plot(cars)
```

Before I can use the functions from a package I have to load up the package from my “library”.

```
library(ggplot2)
ggplot(cars)
```

Every ggplot is made up of at least 3 things: - data (the number etc. that will go into your plot) - aes (how the columns of data map to the plot aesthetics) - geoms (how the plot actually looks, points, bars, lines etc.)

```
ggplot(cars) +
  aes (x = speed, y = dist) +
  geom_point()
```

For simple plots ggplot is more verbose - it takes more code - than base R plot.

```
ggplot(cars) +  
  aes (x = speed, y = dist) +  
  geom_point() +  
  geom_smooth(method="lm") +  
  labs(title = "Stopping distance of old cars", subtitle = "A sill example plot") +  
  theme_bw()
```

`geom\_smooth()` using formula = 'y ~ x'

## Stopping distance of old cars

A sill example plot

```
ggplot(cars) +  
  aes (x = speed, y = dist) +  
  geom_point() +  
  geom_smooth(method="lm", se="FALSE") +  
  labs(title = "Stopping distance of old cars", subtitle = "A sill example plot") +  
  theme_bw()
```

``geom_smooth()`` using formula = `'y ~ x'`

Warning: Computation failed in ``stat_smooth()``  
Caused by error in ``se.fit || interval != "none"``:  
! invalid 'x' type in 'x || y'

## Stopping distance of old cars

A sill example plot

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)
```

	Gene	Condition1	Condition2	State
1	A4GNT	-3.6808610	-3.4401355	unchanging
2	AAAS	4.5479580	4.3864126	unchanging
3	AASDH	3.7190695	3.4787276	unchanging
4	AATF	5.0784720	5.0151916	unchanging
5	AATK	0.4711421	0.5598642	unchanging
6	AB015752.4	-3.6808610	-3.5921390	unchanging

Q. Use the `nrow()` function to find out how many genes are in this dataset. What is your answer?

```
nrow(genes)
```

```
[1] 5196
```

A. 5196 genes

Q. Use the `colnames()` function and the `ncol()` function on the `genes` data frame to find out what the column names are (we will need these later) and how many columns there are. How many columns did you find?

```
colnames(genes)
```

```
[1] "Gene"          "Condition1" "Condition2" "State"
```

```
ncol(genes)
```

```
[1] 4
```

A. 4 columns

Q. Use the `table()` function on the `State` column of this `data.frame` to find out how many ‘up’ regulated genes there are. What is your answer?

```
table(genes$State)
```

down	unchanging	up
72	4997	127

A. 127 up-regulated genes

Q. Using your values above and 2 significant figures. What fraction of total genes is up-regulated in this dataset?

```
round(table(genes$State)/ nrow(genes) * 100, 2)
```

down	unchanging	up
1.39	96.17	2.44

A. 2.44 of total genes up-regulated

```
library(ggplot2)
ggplot(genes)
```

```
p <- ggplot(genes) +  
  aes (x = Condition1, y = Condition2, col = State) +  
  geom_point()  
  
p + scale_colour_manual( values=c("blue","gray","red") ) +  
  labs(title="Gene Expression Changes Upon Drug Treatment",  
        x="Control (no drug) ",  
        y="Drug Treatment")
```

## Gene Expression Changes Upon Drug Treatment

```
# File location online
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder."
gapminder <- read.delim(url)

library(dplyr)
```

Attaching package: 'dplyr'

The following objects are masked from 'package:stats':

filter, lag

The following objects are masked from 'package:base':

intersect, setdiff, setequal, union

```
gapminder_2007 <- gapminder %>% filter(year==2007)
```

```
ggplot(gapminder_2007) +
  aes(x = gdpPerCap, y=lifeExp, color = continent, size = pop) +
  geom_point(alpha = 0.5)
```

```
ggplot(gapminder_2007) +
  aes(x = gdpPerCap, y=lifeExp, color = pop) +
  geom_point(alpha = 0.8)
```

```
ggplot(gapminder_2007) +  
  aes(x = gdpPercap, y=lifeExp, size = pop) +  
  geom_point(alpha = 0.5)
```

```
ggplot(gapminder_2007) +  
  geom_point(aes(x = gdpPercap, y = lifeExp,  
                 size = pop), alpha=0.5) +  
  scale_size_area(max_size = 10)
```

Q. Can you adapt the code you have learned thus far to reproduce our gapminder scatter plot for the year 1957? What do you notice about this plot is it easy to compare with the one for 2007?

```
gapminder_1957 <- gapminder %>% filter(year==1957)

ggplot(gapminder_1957) +
  aes(x = gdpPercap, y = lifeExp, color = continent, size = pop)+
  geom_point(alpha=0.7) +
  scale_size_area(max_size = 10)
```

Q. Do the same steps above but include 1957 and 2007 in your input dataset for `ggplot()`. You should now include the layer `facet_wrap(~year)` to produce the following plot:

```
gapminder_1957 <- gapminder %>% filter(year==1957 | year == 2007)

ggplot(gapminder_1957) +
  aes(x = gdpPercap, y = lifeExp, color = continent, size = pop)+
  geom_point(alpha=0.7) +
  scale_size_area(max_size = 10) +
  facet_wrap(~year)
```
