ENSG00000279457	23	28	29	29	28	46
ENSG00000278566	0	0	0	0	0	0
ENSG00000273547	0	0	0	0	0	0
ENSG00000187634	124	123	205	207	212	258

A lot of our data has 0s in it, so we need to use the rowSums function to filter these out. Q. Complete the code below to filter countData to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

```
# Filter count data where you have 0 read count across all samples.
countData = countData[rowSums(countData) > 0,]
head(countData)
```

	SRR493366	SRR493367	SRR493368	SRR493369	SRR493370	SRR493371
ENSG00000279457	23	28	29	29	28	46
ENSG00000187634	124	123	205	207	212	258
ENSG00000188976	1637	1831	2383	1226	1326	1504

ENSG00000187961	120	153	180	236	255	357
ENSG00000187583	24	48	65	44	48	64
ENSG00000187642	4	9	16	14	16	16

Now lets setup the DESeqDataSet object required for the DESeq() function and then run the DESeq pipeline.

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

```
dds = DESeq(dds)

estimating size factors

estimating dispersions

gene-wise dispersion estimates

mean-dispersion relationship

final dispersion estimates

fitting model and testing
```

dds

class: DESeqDataSet

dim: 15975 6

metadata(1): version

assays(4): counts mu H cooks

rownames(15975): ENSG00000279457 ENSG00000187634 ... ENSG00000276345

ENSG00000271254

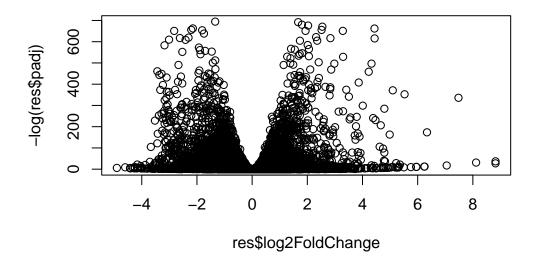

rowData names(22): baseMean baseVar ... deviance maxCooks colnames(6): SRR493366 SRR493367 ... SRR493370 SRR493371

colData names(2): condition sizeFactor

Next, get results for the HoxA1 knockdown versus control siRNA (remember that these were labeled as "hoxa1_kd" and "control_sirna" in our original colData metaFile input to DESeq, you can check this above and by running resultsNames(dds) command).

Q. Call the summary() function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

```
res = results(dds, contrast=c("condition", "hoxa1_kd", "control_sirna"))
  summary(res)
out of 15975 with nonzero total read count
adjusted p-value < 0.1
LFC > 0 (up)
                    : 4349, 27%
LFC < 0 (down)
                    : 4396, 28%
outliers [1]
                    : 0, 0%
                    : 1237, 7.7%
low counts [2]
(mean count < 0)</pre>
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results
#Volcono plot This is a plot of log2 fold change vs -log adjusted p-value.
  plot( res$log2FoldChange, -log(res$padj) )
```

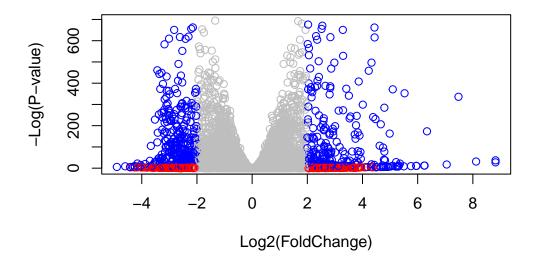

Now lets add some color

```
# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01
# and absolute fold change more than 2
inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col= mycols, xlab="Log2(FoldChange)", ylab="-Log</pre>
```

#Adding gene annotation

Since we mapped and counted against the Ensembl annotation, our results only have information about Ensembl gene IDs. However, our pathway analysis downstream will use KEGG pathways, and genes in KEGG pathways are annotated with Entrez gene IDs. We need to change the annotation into Ensembl key.

```
library("AnnotationDbi")
library("org.Hs.eg.db")
```

columns(org.Hs.eg.db)

```

Q. Reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file="deseq_results.csv")
```

##Section 2. Pathway Analysis The gageData package has pre-compiled databases mapping genes to KEGG pathways and GO terms for common organisms. kegg.sets.hs[sigmet.idx.hs] gives you the "cleaner" gene sets of signaling and metabolic pathways only.

```
library(pathview)
```

Pathview is an open source software package distributed under GNU General Public License version 3 (GPLv3). Details of GPLv3 is available at http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to formally cite the original Pathview paper (not just mention it) in publications or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG license agreement (details at http://www.kegg.jp/kegg/legal.html).

```
library(gage)
```

```
library(gageData)
  data(kegg.sets.hs)
  data(sigmet.idx.hs)
  # Focus on signaling and metabolic pathways only
  kegg.sets.hs = kegg.sets.hs[sigmet.idx.hs]
  # Examine the first 3 pathways

                                                              "8833"
                                                                        "9060"
                        "953"
                                  "9533"
                                           "954"
                                                     "955"
                                                              "956"
                                                                        "957"
[153] "9061"
               "93034"
[161] "9583"
               "9615"
```

The main gage() function requires a named vector of fold changes, where the names of the values are the Entrez gene IDs.

```
foldchanges = res$log2FoldChange
names(foldchanges) = res$entrez
head(foldchanges)
```

```
1266 54855 1465 51232 2034 2317 -2.422719 3.201955 -2.313738 -2.059631 -1.888019 -1.649792
```

Now lets run the pathway analysis:

```
# Get the results
keggres = gage(foldchanges, gsets=kegg.sets.hs)

# Look at the first few down (less) pathways
head(keggres$less)
```

```

```

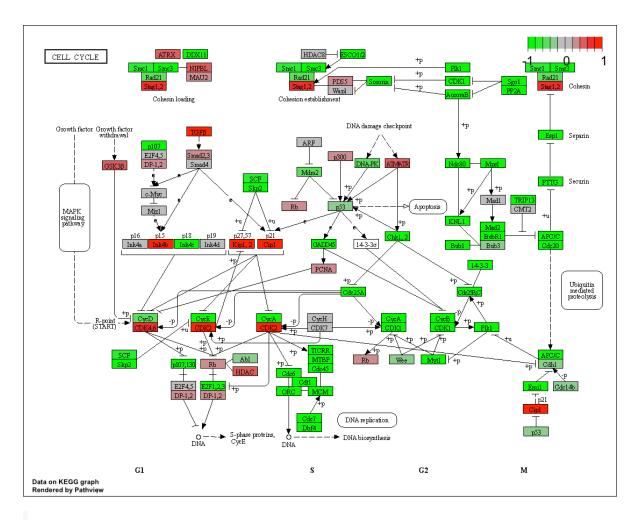

Now lets look at the pathway data.

pathview(gene.data=foldchanges, pathway.id="hsa04110")

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM

Info: Writing image file hsa04110.pathview.png

A different PDF based output of the same data
pathview(gene.data=foldchanges, pathway.id="hsa04110", kegg.native=FALSE)

'select()' returned 1:1 mapping between keys and columns

```
Warning: reconcile groups sharing member nodes!
     [,1] [,2]
[1,] "9" "300"
[2,] "9" "306"
Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM
Info: Writing image file hsa04110.pathview.pdf
Let's process our results a bit more to pull out the top 5 upregulated pathways, then further
process that just to get the pathway IDs needed by the pathview() function. We'll use these
KEGG pathway IDs for pathview plotting below.
  ## Focus on top 5 upregulated pathways here for demo purposes only
  keggrespathways <- rownames(keggres$greater)[1:5]</pre>
  # Extract the 8 character long IDs part of each string
  keggresids = substr(keggrespathways, start=1, stop=8)
  keggresids
[1] "hsa04640" "hsa04630" "hsa00140" "hsa04142" "hsa04330"
  pathview(gene.data=foldchanges, pathway.id=keggresids, species="hsa")
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM
Info: Writing image file hsa04640.pathview.png
'select()' returned 1:1 mapping between keys and columns
```

Info: Writing image file hsa04630.pathview.png

Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM

Info: Writing image file hsa00140.pathview.png

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM

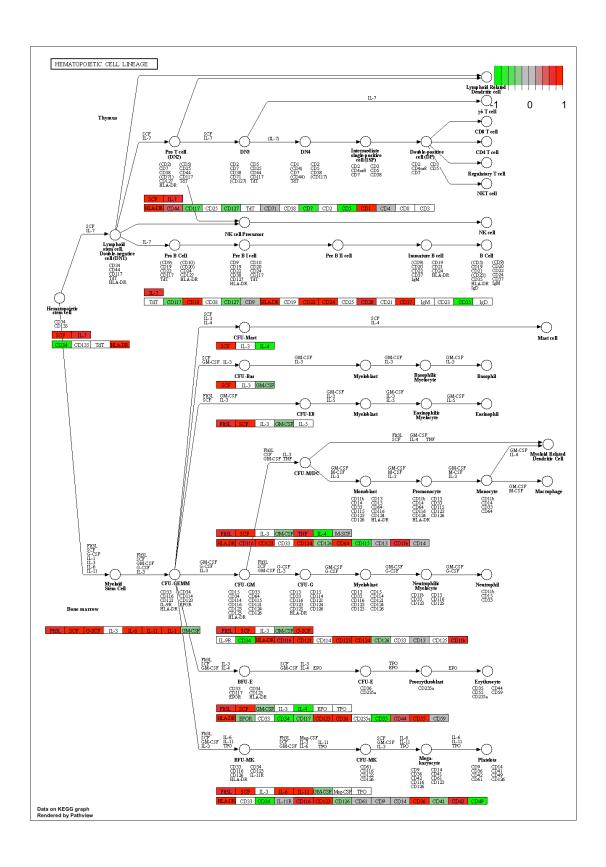

Info: Writing image file hsa04142.pathview.png

Info: some node width is different from others, and hence adjusted!

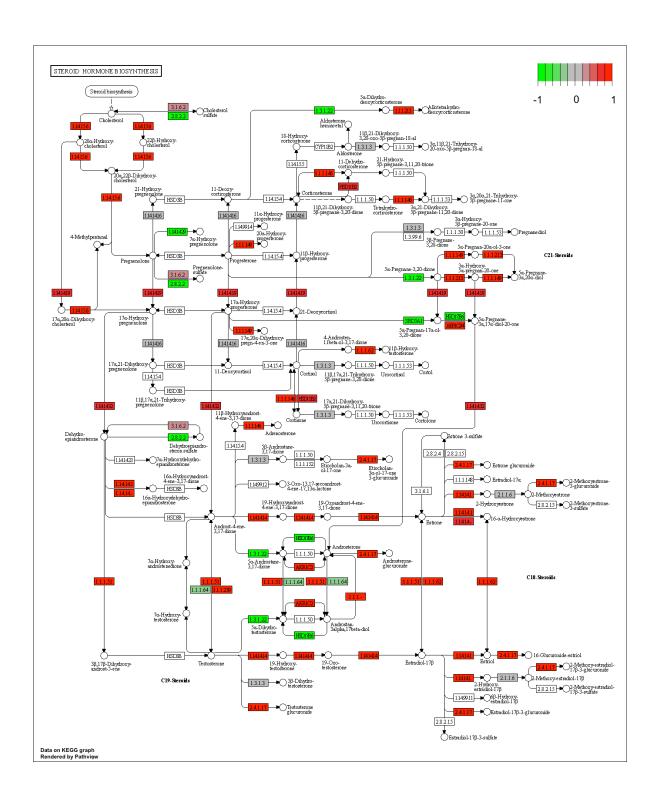

'select()' returned 1:1 mapping between keys and columns

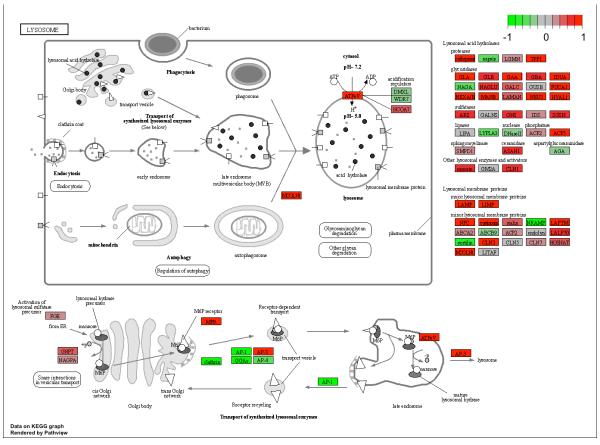

Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM

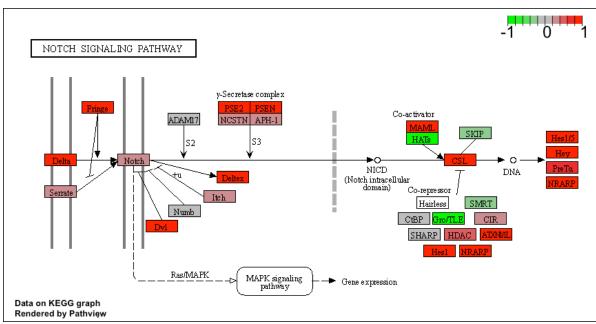

Info: Writing image file hsa04330.pathview.png

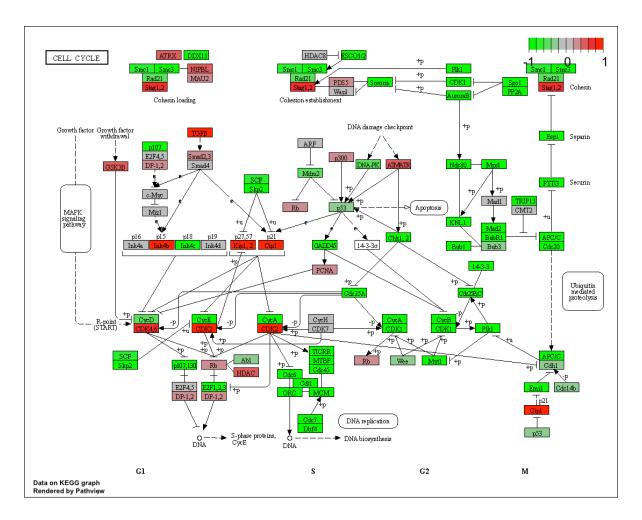

Q. Can you do the same procedure as above to plot the pathview figures for the top 5 down-regulated pathways?

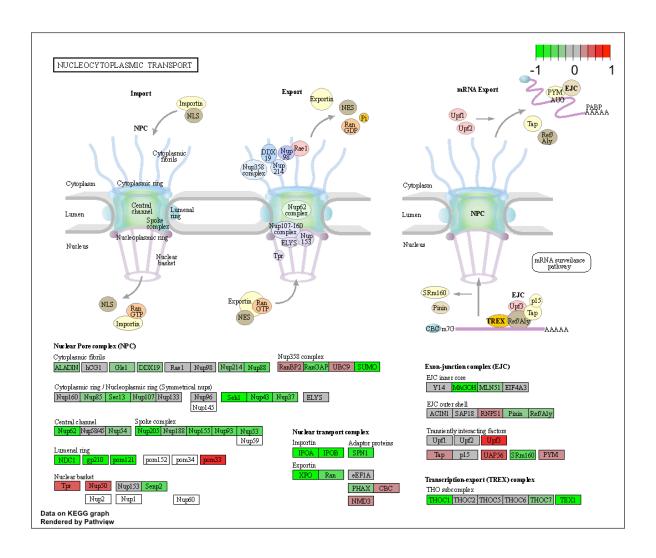

```
## Focus on top 5 downregulated pathways
  keggresless <- rownames(keggres$less)[1:5]</pre>
  # Extract the 8 character long IDs part of each string
  keggreslessids = substr(keggresless, start=1, stop=8)
  keggreslessids
[1] "hsa04110" "hsa03030" "hsa03013" "hsa03440" "hsa04114"
  pathview(gene.data=foldchanges, pathway.id=keggreslessids, species="hsa")
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM
Info: Writing image file hsa04110.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM
Info: Writing image file hsa03030.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM
Info: Writing image file hsa03013.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM
Info: Writing image file hsa03440.pathview.png
```

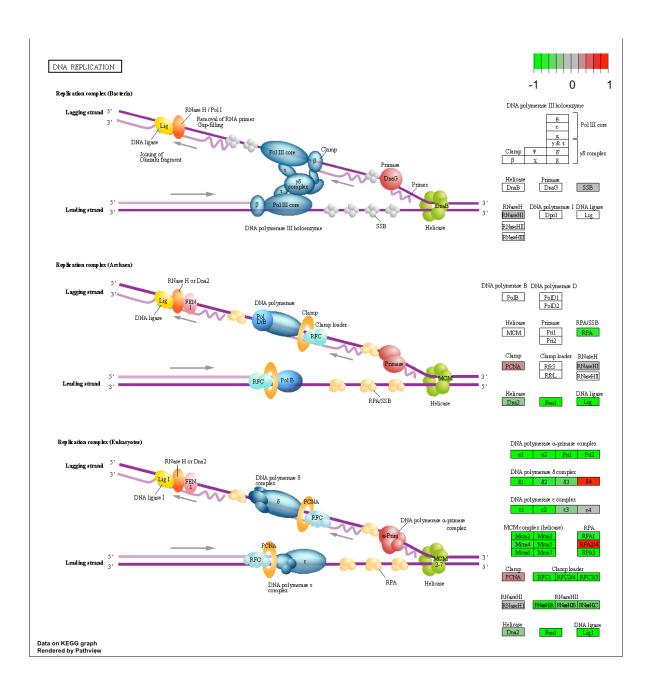

'select()' returned 1:1 mapping between keys and columns

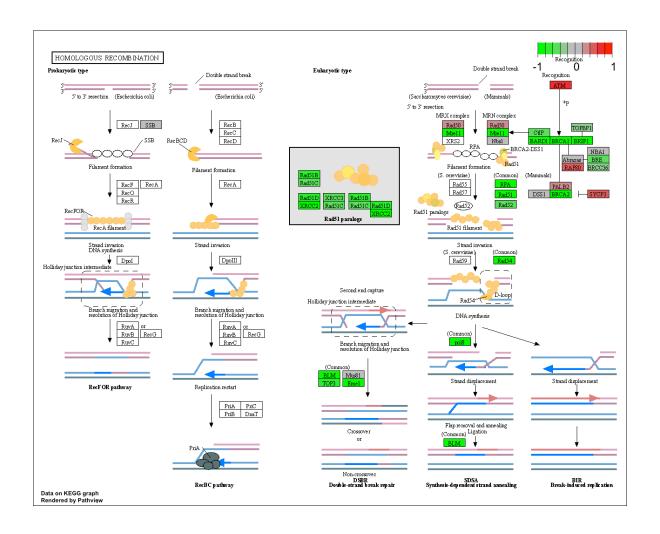

Info: Working in directory /Users/kristiwong/Downloads/UCSD/UCSD Courses/BIOLOGY/BIMM143/BIM

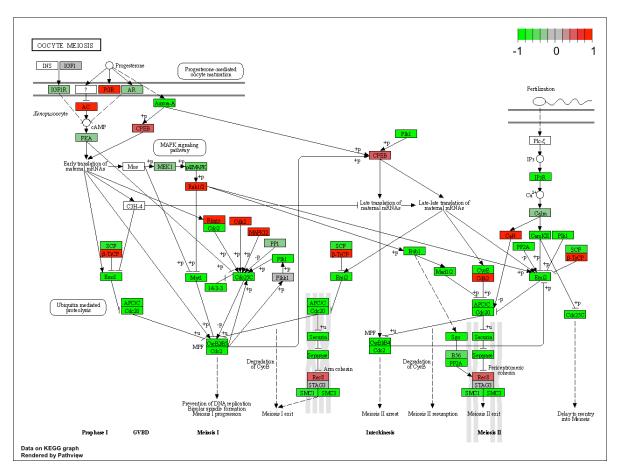

Info: Writing image file hsa04114.pathview.png

##Section 3. Gene Ontology (GO) We can also do a similar procedure with gene ontology. go.subs.hs is a named list containing indexes for the Biological Process ontologies.

```
data(go.sets.hs)
data(go.subs.hs)

# Focus on Biological Process subset of GO
gobpsets = go.sets.hs[go.subs.hs$BP]

gobpres = gage(foldchanges, gsets=gobpsets, same.dir=TRUE)

lapply(gobpres, head)
```

\$greater

##Section 4. Reactome Analysis Reactome is a database consisting of biological molecules and their relation to pathways and processes. Let's now conduct over-representation enrichment analysis and pathway-topology analysis with Reactome using the previous list of significant genes generated from our differential expression results above.

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))</pre>
```

[1] "Total number of significant genes: 8147"

```
write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, quo
```

Perform pathway analysis online at the Reactome website. Select "choose file" to upload your significant gene list. Then, select the parameters "Project to Humans", then click "Analyze".

Q: What pathway has the most significant "Entities p-value"? Do the most significant pathways listed match your previous KEGG results? What factors could cause differences between the two methods? Cell cycle, cell cycle mitotic, mitotic prometaphase, and mitotic spindle checkpoints. This is similar to the KEGG results, which showed that cell cycle and DNA replication were the most significant results. What could cause a difference is the accessibility to data, and that KEGG seems to group the genes in a more broad sense.
